Main Causes

Many social and economical factors affect the dynamics of human populations, such as **poverty, violence, war, dictatorships, persecutions, oppression, genocide, ethnic cleansing, climate change, tsunamis, floods, earthquakes, famines, family reunification as well as economic and educational possibilities or a job.**

Conclusions

Now, with the **COVID-19 pandemic**, declared by the World Health Organization on March 11, 2020, Dolmans et al. (2020) report that COVID-19 is likely to exacerbate what is already a humanitarian emergency in terms of a global refugee crisis. The authors argue that refugees may encounter increased difficulty in seeking asylum due to measures imposed by governments in response to the pandemic.

Notation	Definition
f_{ij}^k	the flow of migrants of class k from country i to country j . The $\{f_{ij}^k\}$ elements for all i and j and fixed k are grouped into the vector $f^k \in R_+^{nn}$. We then further group the f^k vectors; $k = 1, \dots, J$, into the vector $f \in R_+^{Jnn}$.
p_i^k	the nonnegative population of migrant class k in country i . We group the populations of class k ; $k = 1, \dots, J$, into the vector $p^k \in R_+^n$. We then further group all such vectors into the vector $p \in R_+^{Jn}$.
\bar{p}_i^k	the initial fixed population of class k in country i ; $i = 1, \dots, n$; $k = 1, \dots, J$.
$u_i^k(p)$	the utility perceived by class k in country i ; $i = 1, \dots, n$; $k = 1, \dots, J$.
$c_{ij}^k(f)$	the cost of international migration , which includes economic, psychological, and social costs encumbered by class k in migrating from country i to country j ; $i = 1, \dots, n$; $j = 1, \dots, n$; $k = 1, \dots, J$.

Definition (International Human Migration Equilibrium without Regulations)

A vector of populations and international migration flows $(p^*, f^*) \in K^1$ is in equilibrium if it satisfies the equilibrium conditions: For each class k ; $k = 1, \dots, J$ and each pair of countries i, j ; $i = 1, \dots, n$; $j = 1, \dots, n$:

$$u_i^k(p^*) + c_{ij}^k(f^*) \begin{cases} = u_j^k(p^*) - \lambda_i^{k*}, & \text{if } f_{ij}^{k*} > 0 \\ \geq u_j^k(p^*) - \lambda_i^{k*}, & \text{if } f_{ij}^{k*} = 0 \end{cases}$$

and

$$\lambda_i^{k*} \begin{cases} \geq 0, & \text{if } \sum_{l \neq i} f_{il}^{k*} = \bar{p}_i^k, \\ = 0, & \text{if } \sum_{l \neq i} f_{il}^{k*} < \bar{p}_i^k \end{cases}$$

Conclusions

K^3 can be rewritten as follows:

$$K^3 = \left\{ f : -f \leq 0; \sum_j f_{ij}^k - \bar{p}_i^k = 0, \forall i, \forall k; \sum_{i \in C^1} \sum_{k \in C^1} f_{ij}^k - U_j \leq 0 \right\}$$

and the last variational inequality can be rewritten as a **minimization problem**, since if we set:

$$V(f) = \sum_i \sum_j \sum_k (-\hat{u}_j^k(f^*) + c_{ij}^k(f^*)) \times (f_{ij}^k - f_{ij}^{k*}),$$

then we have:

$$V(f) \geq 0 \text{ for } f \in K^3 \text{ and } \min_{f \in K^3} V(f) = V(f^*) = 0.$$

Theorem

If $f^* \in K^3$ is a solution to variational inequality, then the Lagrange multipliers $\bar{\gamma} \in R_+^{Jnn}$, $\bar{\delta} \in R^{Jn}$, and $\bar{\mu}_{\bar{j}} \in R_+$ do exist, and for all i, j, k , and \bar{j} , the following conditions hold true:

$$\bar{\gamma}_{ij}^k (-f_{ij}^{k*}) = 0, \quad \bar{\delta}_{ik} \left(\sum_j f_{ij}^{k*} - \bar{p}_i^k \right) = 0, \quad (d)$$

$$\bar{\mu}_{\bar{j}} \left(\sum_{i \in C^1} \sum_{k \in C^1} f_{ij}^{k*} - U_{\bar{j}} \right) = 0$$

$$-\hat{u}_j^k(f^*) + c_{ij}^k(f^*) - \bar{\gamma}_{ij}^k + \bar{\delta}_{ik} = 0, \quad \text{if } j \neq \bar{j} \quad (e)$$

$$-\hat{u}_{\bar{j}}^k(f^*) + c_{i\bar{j}}^k(f^*) - \bar{\gamma}_{i\bar{j}}^k + \bar{\delta}_{ik} + \bar{\mu}_{\bar{j}} = 0, \quad \text{if } j = \bar{j} \quad (f)$$

Moreover, the **strong duality** also holds true; namely:

$$V(f^*) = \min_{f \in K^3} V(f) = \max_{\gamma \in R_+^{Jnn}, \delta \in R^{Jn}, \mu_{\bar{j}} \in R_+} \min_{f \in R^{Jnn}} \mathcal{L}(f, \gamma, \delta, \mu_{\bar{j}})$$

$$\bar{\delta}_{ik} + c_{ij}^k(f^*) = \hat{u}_j^k(f^*) + \bar{\gamma}_{ij}^k \quad \text{equivalently:} \quad \bar{\delta}_{ik} + c_{ij}^k(f^*) \geq \hat{u}_j^k(f^*)$$

- If $f_{ii}^{k*} > 0$, then from (d) it follows, since $c_{ii} = 0$, that

$$0 + \bar{\delta}_{ik} = \hat{u}_i^k(f^*) \quad \text{and, hence,} \quad \bar{\delta}_{ik} = \hat{u}_i^k(f^*).$$

Conclusions

If we consider a destination node \bar{j} , under the regulation, and, if $f_{ij}^{k*} > 0$, then (d) applies and we obtain:

$$\bar{\delta}_{ik} + c_{ij}^k(f^*) = \hat{u}_j^k(f^*) - \bar{\mu}_{\bar{j}}$$

If the upper bound holds tightly, then the migrants incur a higher utility at destination node \bar{j} than just the sum of the origin node utility and the migration cost.

Positions

- $\mathcal{K} \equiv K^4$
- $X \equiv (f, \delta, \mu_{\bar{j}})$
- $N = Jnn + Jn + 1$
- $F \equiv (F_1, F_2, F_3, F_4)$: the components of F_1 consist of the elements: $-\hat{u}_j^k(f) + c_{ij}^k(f) + \delta_{ik}$, for $i; i \notin C^1$ and $j \neq \bar{j}$, and $k; k \notin C^1$; the components of F_2 consist of the elements: $-\hat{u}_j^k(f) + c_{ij}^k(f) + \delta_{ik} + \mu_{\bar{j}}$, for $i \in C^1$ and $k \in C^1$; F_3 consists of the elements: $\bar{p}_i^k - \sum_j f_{ij}^k, \forall i, k$, and, finally, F_4 consists of the single element: $U_{\bar{j}} - \sum_{i \in C^1} \sum_{k \in C^1} f_{ij}^k$

Standard Variational Inequality

Determine $X^* \in \mathcal{K}$ such that

$$\langle F(X^*), X - X^* \rangle \geq 0, \quad \forall X \in \mathcal{K}$$

Conclusions

- **Step 0: Initialization** Initialize with $X^0 \in \mathcal{K}$. Set $t := 1$ and let β be a scalar such that $0 < \beta \leq \frac{1}{L}$, where L is the Lipschitz constant
- **Step 1: Computation** Compute \bar{X}^t by solving the variational inequality subproblem:

$$\langle \bar{X}^t + \beta F(X^{t-1}) - X^{t-1}, X - \bar{X}^t \rangle \geq 0, \quad \forall X \in \mathcal{K}$$

- **Step 2: Adaptation** Compute X^t by solving the variational inequality subproblem:

$$\langle X^t + \beta F(\bar{X}^t) - X^{t-1}, X - X^t \rangle \geq 0, \quad \forall X \in \mathcal{K}$$

- **Step 3: Convergence Verification**
If $|X^t - X^{t-1}| \leq \epsilon$, with $\epsilon > 0$, a pre-specified tolerance, then stop; otherwise, set $t := t + 1$ and go to Step 1
